

MATH681  
Mathematical Logic

Pingbang Hu

January 19, 2023

## Abstract

This is a graduate-level mathematical logic course taught by [Matthew Harrison-Trainor](#), aiming to obtain insights into all other branches of mathematics, such as algebraic geometry, analysis, etc. Specifically, we will cover model theory beyond the basic foundational ideas of logic.

While there are no required textbooks, some books do cover part of the material in the class. For example, Marker's *Model Theory: An Introduction* [[Mar02](#)], Hodges's *A Shorter Model Theory* [[HH97](#)], and Hinman's *Fundamentals of Mathematical Logic* [[Hin05](#)].

## Language, Logic, and Structures

### Lecture 1: Introduction to Mathematical Logic

#### 1.1 What's Mathematical Logic?

5 Jan. 14:30

The goal of mathematical logic is to obtain insights into other areas of mathematics – algebra, analysis, combinatorics, and so on, by formalizing the **process** of mathematics.

**Remark.** More concretely, there are different branches:

- (a) Model Theory: Study subsets of an object defined by a formula (i.e., first-order logic).
- (b) Computability Theory / Recursion Theory: Formalizing what it means to have an algorithm and studying relative computability.
- (c) Set Theory: Study the structure of the mathematical universe.
- (d) Proof Theory: Study the syntactic nature of proofs.

In this class, we study model theory in nature; specifically, we will cover

- basic definitions of logic:
  - What is a formula?
  - What does it mean for a formula to be true?
  - What is a proof?
- Soundness & completeness theorems:
  - Anything provable is true.
  - Anything true is provable.
- Compactness theorem:
  - Non-standard objects exist.
- Using compactness theorem for applications:
  - Chevalley's theorem

The main theme of this course will be *syntax* v.s. *semantics*:

Syntax	v.s.	Semantics
proofs		truth
form of a formula		mathematical structures
number and type of quantifiers		isomorphisms, embeddings

## 1.2 Syntax and Semantics

### 1.2.1 Languages and Structures

Let's start with the fundamental object, [language](#).

**Definition 1.2.1 (Language).** A *language*  $\mathcal{L}$  consists of:

- a set  $\mathcal{F}$  of function symbols  $f$  with arities  $n_f$ ;
- a set  $\mathcal{R}$  of relation symbols  $R$  with arities  $n_R$ ;
- a set  $\mathcal{C}$  of constant symbols  $c$ .

A [language](#) is also sometimes called a *signature*, in which case we use  $\sigma$  rather than  $\mathcal{L}$ .

**Note.** A constant is the same as a 0-ary function.

**Remark.** Any or all sets in [Definition 1.2.1](#) might be empty.

**Example (Graph).** The [language](#) of graphs,  $\mathcal{L}_{\text{graph}} = \{E\}$  where  $E$  is a binary (2-ary) relation symbol.

**Example (Ring).** The [language](#) of rings,  $\mathcal{L}_{\text{ring}} = \{0, 1, +, \cdot, -\}$ , where  $0, 1$  are constants,  $+, \cdot$  are binary functions, and  $-$  is a unary function.

**Example (Ordered ring).** The [language](#) of ordered rings,  $\mathcal{L}_{\text{ord}} = \mathcal{L}_{\text{ring}} \cup \{\leq\}$  where  $\leq$  is the binary relation for an ordered ring.

Then, given a [language](#), we can now interpret it in the following way.

**Definition 1.2.2 (Structure).** Given a [language](#)  $\mathcal{L}$ , an  $\mathcal{L}$ -*structure*  $\mathcal{M}$  consists of:

- a non-empty set  $M$  called the *universe*, *domain*, or *underlying set* of  $\mathcal{M}$ ;
- for each function symbol  $f \in \mathcal{F}$ , a function  $f^{\mathcal{M}}: M^{n_f} \rightarrow M$ ;
- for each relation symbol  $R \in \mathcal{R}$ , a relation  $R^{\mathcal{M}} \subseteq M^{n_R}$ ;
- for each constant symbol  $c \in \mathcal{C}$ , an element  $c^{\mathcal{M}} \in M$ .

**Note (Interpretation).** We call  $f^{\mathcal{M}}, R^{\mathcal{M}}, c^{\mathcal{M}}$  the *interpretation in  $\mathcal{M}$*  of symbols  $f, R, c$ , respectively.

Basically, a [structure](#) gives meaning to the symbols from the [language](#), and we often write

$$\mathcal{M} = (M, f^{\mathcal{M}}, \dots, R^{\mathcal{M}}, \dots, c^{\mathcal{M}}, \dots) = (M, f^{\mathcal{M}}, R^{\mathcal{M}}, c^{\mathcal{M}}: f \in \mathcal{F}, R \in \mathcal{R}, c \in \mathcal{C}).$$

**Notation.** We usually use  $\mathcal{M}, \mathcal{N}, \dots, \mathcal{A}, \mathcal{B}, \dots$  to refer to [structures](#), and  $M, N, \dots, A, B, \dots$  for the domains.<sup>a</sup>

<sup>a</sup>Some people use  $|\mathcal{M}|$  for the domain of  $\mathcal{M}$ .

It's time to look at some examples.

**Example.** The rationals  $\mathbb{Q}$  and integers  $\mathbb{Z}$  are both  $\mathcal{L}_{\text{ring}}$ -structures.

**Proof.** Clearly, the domain is the set of rationals, and naively, we let  $+^{\mathbb{Q}} = +$  in  $\mathbb{Q}$ ,  $0^{\mathbb{Q}} = 0$  in

$\mathbb{Q}$ ,  $1^{\mathbb{Q}} = 1$  in  $\mathbb{Q}$ , etc. In this way,  $\mathbb{Q} = (\mathbb{Q}, 0, 1, +, \cdot, -)$  is an  $\mathcal{L}_{\text{ring}}$ -structure. Similarly,  $\mathbb{Z} = (\mathbb{Z}, 0, 1, +, \cdot, -)$  is as well.  $\circledast$

While the language we have seen are all intuitively correct with their name, i.e.,  $\mathcal{L}_{\text{ring}}$ ,  $\mathcal{L}_{\text{ord}}$ , and  $\mathcal{L}_{\text{graph}}$ , they are really just the high-level abstraction of the objects in the subscript.

**Example.** Nothing forces an  $\mathcal{L}_{\text{ring}}$ -structure to be a ring.

**Proof.** Since an  $\mathcal{L}_{\text{ring}}$ -structure is just any structure with two binary functions, a unary function, and two constants interpreting the symbols of the language; hence we can define an  $\mathcal{L}_{\text{ring}}$ -structure  $\mathcal{M}$  as

- $\mathcal{M} = \{0, 5, 11\}$ ;
- $0^{\mathcal{M}} = 5$ ;
- $1^{\mathcal{M}} = 11$ ;
- $+^{\mathcal{M}}$  is the constant function 0;
- $\cdot^{\mathcal{M}}$  is the function 5;
- $-^{\mathcal{M}}$  is the identity.

This is clearly not a ring since it fails nearly every axiom of a ring.  $\circledast$

**Note.** Later, we will talk about theories that let us restrict to structures we want.

## 1.2.2 Embeddings and Isomorphisms

We can now consider the relation between structures.

**Definition 1.2.3 (Embedding).** Let  $\mathcal{M}$  and  $\mathcal{N}$  be  $\mathcal{L}$ -structures. A map  $\eta: \mathcal{M} \rightarrow \mathcal{N}$  is an  $\mathcal{L}$ -embedding if it is one-to-one and preserves the interpretation of all symbols of  $\mathcal{L}$ :

- (a) for each  $f \in \mathcal{F}$  of arity  $n_f$ , and  $a_1, \dots, a_{n_f} \in \mathcal{M}$ ,

$$\eta(f^{\mathcal{M}}(a_1, \dots, a_{n_f})) = f^{\mathcal{N}}(\eta(a_1), \dots, \eta(a_{n_f}));$$

- (b) for each relation  $R \in \mathcal{R}$  of arity  $n_R$ , and  $a_1, \dots, a_{n_R} \in \mathcal{M}$ ,

$$(a_1, \dots, a_{n_R}) \in R^{\mathcal{M}} \Leftrightarrow (\eta(a_1), \dots, \eta(a_{n_R})) \in R^{\mathcal{N}};$$

- (c) for each constant  $c \in \mathcal{C}$ ,  $\eta(c^{\mathcal{M}}) = c^{\mathcal{N}}$ .

From the definition, an  $\mathcal{L}$ -embedding is an injection, and naturally, we have the following.

**Definition 1.2.4 (Isomorphism).** An  $\mathcal{L}$ -isomorphism is a bijective  $\mathcal{L}$ -embedding.

**Definition 1.2.5 (Automorphism).** An  $\mathcal{L}$ -automorphism of  $\mathcal{M}$  is an  $\mathcal{L}$ -isomorphism from  $\mathcal{M}$  to  $\mathcal{M}$ .

**Definition.** Let  $\mathcal{M}$  and  $\mathcal{N}$  be  $\mathcal{L}$ -structures. Suppose  $M \subseteq N$  and the inclusion map  $\iota: M \hookrightarrow N$  is an  $\mathcal{L}$ -embedding.

**Definition 1.2.6 (Substructure).**  $\mathcal{M}$  is a substructure of  $\mathcal{N}$ .

**Definition 1.2.7 (Extension).**  $\mathcal{N}$  is an extension of  $\mathcal{M}$ .

**Example.** Ring **embeddings** are  $\mathcal{L}_{\text{ring}}$ -**embeddings**.

This generalizes the notions of embedding and isomorphism for many mathematical structures.

**Remark.** Asking that  $\eta$  be injective is the same as (b) in [Definition 1.2.3](#) for the relation  $=$  since

$$a = b \in \mathcal{M} \Leftrightarrow \eta(a) = \eta(b) \in \mathcal{N}.$$

The notion of **substructure** is **language** sensitive. For groups, there are two possible **languages**:

- (a)  $\mathcal{L}_1 = \{e, \cdot\}$ ;
- (b)  $\mathcal{L}_2 = \{e, \cdot, {}^{-1}\}$ , i.e., with the unary inverse operation.

While both seem valid at the first glance, we should use the second one.

**Remark.** Using  $\mathcal{L}_2$ , the **substructure** of a group is the same thing as a subgroup. But if we use  $\mathcal{L}_1$ , then  $(\mathbb{N}, +, 0)$  is a **substructure** of  $(\mathbb{Z}, +, 0)$ , while  $\mathbb{N}$  is not a group for sure.

**Proof.** Simply observe that both  $(\mathbb{N}, 0, +)$ ,  $(\mathbb{Z}, 0, +)$  are  $\mathcal{L}_1$ -**structures**. ⊗

Similarly, we include  $-$  in  $\mathcal{L}_{\text{ring}}$  for a similar reason as in the previous [example](#).

**Example.** An  $\mathcal{L}_{\text{ring}}$ -**substructure** of a field will be a subring, not a subfield. If we want subfields, use  $\mathcal{L}_{\text{ring}} \cup \{{}^{-1}\}$ .<sup>a</sup>

<sup>a</sup>We can set  $0^{-1} = 0$ , but never use this.

## Lecture 2: Formulas and First-Order Logic

We start by asking that given a function symbol  $f$  of arity  $n$ , could we replace  $f$  with an  $(n+1)$ -ary  $R$  relation to represent its graph? 10 Jan. 14:30

**Example.** Let  $\mathcal{L}$  be a **language** with only relation symbols. Let  $\mathcal{A}$  be an  $\mathcal{L}$ -**structure**. For any  $B \subseteq A$ , there is a **substructure**  $\mathcal{B}$  of  $\mathcal{A}$  with domain  $B$ .

**Proof.** For each relation symbol  $R$ , letting  $R^{\mathcal{B}} = R^{\mathcal{A}} \cap B^{n_R}$  will make  $\mathcal{B}$  a **substructure** of  $\mathcal{A}$ . ⊗

The above is not true for function symbols though.

**Example.** If  $G = (\mathbb{Z}, 0, +)$ , then  $\mathbb{N}$  is not the domain of a subgroup. So if we took  $\mathcal{L} = \{0, +, {}^{-1}\}$ , where  $0$  is the unary relation,  $+$  is the ternary relation, and  ${}^{-1}$  is the binary relation, an  $\mathcal{L}$ -**substructure** of a group might not be a subgroup.

## 1.3 First-Order Logic

### 1.3.1 Terms, Formulas, and Truths

Intuitive, an  $\mathcal{L}$ -**formula** is an expression built using the symbols in a **language**  $\mathcal{L}$ ,  $=$ , the logical connectives  $\wedge, \vee, \neg$ , and variable symbols  $v_1, v_2, \dots, x, y, z$ , and also quantifiers  $\exists$  and  $\forall$ .

**Definition 1.3.1 (Term).** Given a **language**  $\mathcal{L}$ , the set of  $\mathcal{L}$ -**terms** are defined inductively by:

- (a) each constant symbol is a *term*;
- (b) each variable symbol  $v_1, \dots$  is a *term*;
- (c) if  $f$  is a function symbol, and  $t_1, \dots, t_{n_f}$  are **terms**, then  $f(t_1, \dots, t_{n_f})$  is a *term*.

If  $\mathcal{M}$  is an  $\mathcal{L}$ -structure, and  $t$  is a term involving only variables among  $v_1, \dots, v_n$ , then  $t$  has an interpretation  $t^{\mathcal{M}}: M^n \rightarrow M$  as a function as follows. On input  $a_1, \dots, a_n \in M$ ,

- (a) if  $t$  is a constant  $c$ ,  $t^{\mathcal{M}}(a_1, \dots, a_n) = c^{\mathcal{M}}$ .
- (b) if  $t$  is a variable  $v_i$ ,  $t^{\mathcal{M}}(a_1, \dots, a_n) = a_i$ ;
- (c) if  $t$  is  $f(s_1, \dots, s_k)$ , then  $t^{\mathcal{M}}(a_1, \dots, a_n) = f^{\mathcal{M}}(s_1^{\mathcal{M}}(a_1, \dots, a_n), \dots, s_k^{\mathcal{M}}(a_1, \dots, a_n))$ .

**Intuition.** We are basically substituting for variables and evaluating the expression.

**Example.** In  $(\mathbb{R}, 0, 1, +, \cdot, -)$ , a term is essentially just a polynomial with integer coefficients, assuming we interpret them in a ring. Technically, a term looks like

$$\cdot(+ (1, 1), + (x, y)),$$

but we will write terms the natural way, i.e.,

$$(1 + 1)(x + y).$$

Also, we will use  $\underline{n}$  or  $n$  to represent the term  $\underline{n} = \underbrace{1 + 1 + \dots + 1}_{n \text{ times}}$ . So we could write the above term as  $2 \cdot (x + y)$ .

**Definition 1.3.2 (Formula).** The set of  $\mathcal{L}$ -formulas are defined inductively:

- (a) If  $s, t$  are terms,  $s = t$  is a formula.
- (b) If  $R$  is a relation symbol of arity  $n_R$ , and  $s_1, \dots, s_{n_R}$  are term, then  $R(s_1, \dots, s_{n_R})$  is a formula.
- (c) If  $f$  is a formula, then  $\neg f$  is a formula.
- (d) If  $\varphi$  and  $\psi$  are formulas, then  $\varphi \wedge \psi$  and  $\varphi \vee \psi$  are formulas.
- (e) If  $\varphi$  is a formula, and  $v_i$  are variables, then  $\exists v_i \varphi$  and  $\forall v_i \varphi$  are formulas.

**Notation** (Atomic formula). Definition 1.3.2 (a) and (b) are called *atomic formulas*.

**Notation** (Quantifier-free formula). Definition 1.3.2 (a), (b), (c), and (d) are called *quantifier-free formulas*.

This logic is called *first-order logic* (FO logic), since the quantifiers range over elements of the structures, but not over, e.g., subsets.

**Example.** We can say that an element  $x$  of a ring has a square root by  $\exists y \ y^2 = x$ .

**Example.** A group is torsion of order 2 can be said by  $\forall x \ x \cdot x = e$ .

**Example.** We can write down all the field/group/... axioms as formulas.

Notice that for the first example, the formula  $\exists y \ y^2 = x$  only has meaning if we assign what  $x$  is. In this case, we say that  $y$  is *bound* by  $\exists y$ . But this is local:

**Example.** Consider

$$y = 1 \wedge \exists y \ y^2 = x,$$

while the first appearance of  $y$  is free, the second appearance of  $y$  is bound by (in the scope of)  $\exists y$ .

While our definitions work perfectly fine with the above example, but sometimes we don't want this to happen. In such a case, we simply replace the bound instances of  $y$  with a new variable  $z$ . This idea of variables being free or bound is defined formally as follows.

**Definition 1.3.3 (Free variable).** The *free variables*  $FV(\varphi)$  of a *formula*  $\varphi$  are defined inductively:

- (a)  $FV(s = t)$  is the set of variables showing up in  $s$  or  $t$ .
- (b)  $FV(R(s_1, \dots, s_{n_R}))$  is the set of variables showing up in  $s_1, \dots, s_{n_R}$ .
- (c)  $FV(\neg\varphi) = FV(\varphi)$ .
- (d)  $FV(\varphi \wedge \psi) = FV(\varphi \vee \psi) = FV(\varphi) \cup FV(\psi)$ .
- (e)  $FV(\exists x \varphi) = FV(\forall x \varphi) = FV(\varphi) \setminus \{x\}$ .

**Example.**  $FV(\exists y y^2 = x) = \{x\}$ .

**Example.**  $FV(\forall x x \cdot x = e) = \emptyset$ .

**Definition 1.3.4 (Sentence).** A *formula*  $\varphi$  is called a *sentence* if it has no *free variables*.

**Notation.** If  $\varphi$  is a *formula* with *free variables* among  $x_1, \dots, x_n$  we often write  $\varphi(x_1, \dots, x_n)$ .

**Remark.** So given  $\varphi(x_1, \dots, x_n)$ , we know that  $\varphi$  has no other *free variables* than  $x_1, \dots, x_n$ .

**Example.** It's valid to write  $\varphi(x, y, z) := x = y$ .

**Definition 1.3.5 (Truth).** Given an  $\mathcal{L}$ -structure  $\mathcal{M}$ , let  $\varphi(x_1, \dots, x_n)$  be an  $\mathcal{L}$ -formula and let  $a_1, \dots, a_n \in M$ . Then we say  $\varphi$  is *true* of  $\bar{a}$  in  $\mathcal{M}$ ,<sup>a</sup> denoted as  $\mathcal{M} \models \varphi(\bar{a})$ , as follows:

- (a) If  $\varphi$  is  $s = t$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if  $s^{\mathcal{M}}(\bar{a}) = t^{\mathcal{M}}(\bar{a})$ .
- (b) If  $\varphi$  is  $R(t_1, \dots, t_{n_R})$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if  $(t_1^{\mathcal{M}}(\bar{a}), \dots, t_{n_R}^{\mathcal{M}}(\bar{a})) \in R^{\mathcal{M}}$ .
- (c) If  $\varphi$  is  $\neg\psi$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if  $\mathcal{M} \not\models \psi(\bar{a})$ .
- (d) If  $\varphi$  is  $\psi_1 \wedge \psi_2$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if  $\mathcal{M} \models \psi_1(\bar{a})$  and  $\mathcal{M} \models \psi_2(\bar{a})$ .
- (e) If  $\varphi$  is  $\psi_1 \vee \psi_2$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if  $\mathcal{M} \models \psi_1(\bar{a})$  or  $\mathcal{M} \models \psi_2(\bar{a})$ .
- (f) If  $\varphi$  is  $\exists y \psi(\bar{x}, y)$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if there's  $b \in \mathcal{M}$  such that  $\mathcal{M} \models \psi(\bar{a}, b)$ .
- (g) If  $\varphi$  is  $\forall y \psi(\bar{x}, y)$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if for all  $b \in \mathcal{M}$  such that  $\mathcal{M} \models \psi(\bar{a}, b)$ .

<sup>a</sup>Or  $\mathcal{M}$  satisfies  $\varphi(\bar{a})$ .

**Remark.** Every *formula* is *true*, or its negation is.

## Lecture 3: Logical Consequence and Equivalence

**Notation** (Material implication). The *material implication*  $\varphi \rightarrow \psi$  between two *formulas*  $\varphi, \psi$  is an abbreviation of  $\neg\varphi \vee \psi$ .

12 Jan. 14:30

**Notation.** We use  $\varphi \leftrightarrow \psi$  as an abbreviation of  $((\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi))$ .

Essentially,  $\rightarrow$  and  $\leftrightarrow$  is different from  $\Rightarrow$  and  $\Leftrightarrow$ , where the former are only shown in [formula](#). Now, consider the [language of graphs](#)  $\mathcal{L}_{\text{graph}} = \{E\}$ , let's see some examples.

**Example.** An undirected graph can be written as

$$\forall x \forall y (xEy \rightarrow yEx),$$

where we see that any model of this [sentence](#) is undirected.

**Example.** A vertex has at least three neighbors can be written as

$$\varphi(x) := \exists u \exists v \exists w (xEu \wedge xEv \wedge xEw \wedge u \neq v \wedge v \neq w \wedge u \neq w)$$

in non-reflexive graphs.

**Example.** For a vertex has exactly three neighbors,

$$\psi(x) := \exists u \exists v \exists w \forall y (xEu \wedge xEv \wedge xEw \wedge u \neq v \wedge v \neq w \wedge u \neq w \wedge (y = u \vee y = v \vee y = w \vee \neg yEx)).$$

**Problem.** Can we say that  $x$  has an even number of neighbors?

**Answer.** We can't. Some things are not expressible in FO logic. ⊛

**Example.** For a vertex  $x$  has a path of length 4 to  $y$ ,

$$\Theta(x, y) := \exists u \exists v \exists w (xEu \wedge uEv \wedge vEw \wedge wEy).$$

We can also express that there is a path of length at most 4.

**Problem.** Can we say that there is a path from  $x$  to  $y$ ?

**Answer.** We still can't! Not in FO logic (using compactness theorem). ⊛

**Remark.** When we prove results by induction on [formulas](#), we only need to prove for  $\neg, \wedge, \exists$ , instead of for both  $\wedge, \vee$ , and both  $\exists$  and  $\forall$ .

**Proof.** Since we can view  $\varphi \vee \psi$  as an abbreviation for  $\neg(\neg\varphi \wedge \neg\psi)$  and  $\forall x \varphi$  as an abbreviation for  $\neg(\exists x \neg\varphi)$ . ⊛

**Remark (Sheffer stroke).** In fact, we can get  $\wedge, \vee, \neg$  from one logical connective, e.g., the *sheffer stroke*  $\uparrow$ , which is defined as

$$\varphi \uparrow \psi := \neg(\varphi \wedge \psi),$$

and we can use  $\uparrow$  to define  $\neg, \vee, \wedge$ .

**Notation.** Let  $\Phi$  be a (possibly infinite) set of [sentences](#), we write  $\mathcal{M} \models \Phi$  if  $\mathcal{M} \models \varphi$  for all  $\varphi \in \Phi$ .

**Definition 1.3.6 (Logical consequence).** Let  $\Phi$  be a set of [sentences](#), and  $\varphi$  be a [sentence](#). We say that  $\varphi$  is a *logical consequence* of  $\Phi$ , written  $\Phi \models \varphi$ , if  $\mathcal{M} \models \varphi$  whenever  $\mathcal{M} \models \Phi$  in all models  $\mathcal{M}$ .

If  $\Phi = \emptyset$  is the empty set, [Definition 1.3.6](#) is written as  $\models \varphi$ , i.e.,  $\varphi$  is [true](#) in all  $\mathcal{L}$ -structures.<sup>1</sup>

<sup>1</sup>Recall that we always have a [language](#)  $\mathcal{L}$  implicitly.

**Definition 1.3.7 (Equivalent).** Given two formulas  $\varphi, \psi$ ,  $\varphi(\bar{x})$  and  $\psi(\bar{x})$  are *equivalent* if

$$\models \forall \bar{x} (\varphi(\bar{x}) \leftrightarrow \psi(\bar{x})).$$

**Problem.** Two sentences  $\varphi$  and  $\psi$  are *equivalent* if and only if  $\varphi \models \psi$  and  $\psi \models \varphi$ .

DIY

**As previously seen.**  $\mathcal{A}$  is a *substructure* of  $\mathcal{B}$ , or  $\mathcal{A} \subseteq \mathcal{B}$ , means that  $A \subseteq B$  and  $\text{id}: A \hookrightarrow B$  is an  $\mathcal{L}$ -embedding.

**Proposition 1.3.1.** Suppose that  $\mathcal{A}$  is a *substructure* of  $\mathcal{B}$ , and  $\varphi(\bar{x})$  is a *quantifier-free formula*. Let  $\bar{a} \in \mathcal{A}$ ,<sup>a</sup> then  $\mathcal{A} \models \varphi(\bar{a})$  if and only if  $\mathcal{B} \models \varphi(\bar{a})$ .

<sup>a</sup>Formally, we need to write  $\mathcal{A}$  to be the Cartesian product with a fixed length.

**Proof.** We start with *terms* by proving that if  $t$  is a *term* and  $\bar{b} \in \mathcal{A}$ , then  $t^{\mathcal{A}}(\bar{b}) = t^{\mathcal{B}}(\bar{b})$ . The proof is induction on *terms*.

- (a) If  $t$  is a constant symbol  $c$ , then  $t^{\mathcal{A}}(\bar{b}) = c^{\mathcal{A}} = c^{\mathcal{B}} = t^{\mathcal{B}}(\bar{b})$ .
- (b) If  $t$  is a variable  $x_i$ , then  $t^{\mathcal{A}}(\bar{b}) = b_i = t^{\mathcal{B}}(\bar{b})$ .
- (c) If  $t$  is a function symbol  $f(s_1, \dots, s_n)$  where  $s_i$  are *terms*, then  $t^{\mathcal{A}}(\bar{b}) = f^{\mathcal{A}}(s_1^{\mathcal{A}}(\bar{b}), \dots, s_n^{\mathcal{A}}(\bar{b}))$ .  
By the induction hypothesis,  $s_i^{\mathcal{A}}(\bar{b}) = s_i^{\mathcal{B}}(\bar{b}) \in \mathcal{A}$ , and hence

$$t^{\mathcal{B}}(\bar{b}) = f^{\mathcal{B}}(s_1^{\mathcal{B}}(\bar{b}), \dots, s_n^{\mathcal{B}}(\bar{b})) = f^{\mathcal{A}}(s_1^{\mathcal{A}}(\bar{b}), \dots, s_n^{\mathcal{A}}(\bar{b})) = t^{\mathcal{A}}(\bar{b}),$$

i.e.,  $f^{\mathcal{B}} \upharpoonright_{\mathcal{A}} = f^{\mathcal{A}}$ , so  $t^{\mathcal{A}}(\bar{b}) = t^{\mathcal{B}}(\bar{b})$ .

Now we turn to *formulas*, and prove that for  $\varphi$  *quantifier-free*, then  $\mathcal{A} \models \varphi(\bar{a}) \Leftrightarrow \mathcal{B} \models \varphi(\bar{a})$  for  $\bar{a} \in \mathcal{A}$ . The proof is, again, induction on *formulas*.<sup>a</sup>

- (a) If  $\varphi$  is  $s = t$ , then  $s^{\mathcal{A}}(\bar{a}) = s^{\mathcal{B}}(\bar{a})$  and  $t^{\mathcal{A}}(\bar{a}) = t^{\mathcal{B}}(\bar{a})$ , so

$$\mathcal{A} \models \varphi(\bar{a}) \Leftrightarrow s^{\mathcal{A}}(\bar{a}) = t^{\mathcal{A}}(\bar{a}) \Leftrightarrow s^{\mathcal{B}}(\bar{a}) = t^{\mathcal{B}}(\bar{a}) \Leftrightarrow \mathcal{B} \models \varphi(\bar{a}).$$

- (b) If  $\varphi$  is  $R(s_1, \dots, s_n)$ , then

$$\mathcal{A} \models \varphi(\bar{a}) \Leftrightarrow (s_1^{\mathcal{A}}(\bar{a}), \dots, s_n^{\mathcal{A}}(\bar{a})) \in R^{\mathcal{A}} \Leftrightarrow (s_1^{\mathcal{B}}(\bar{a}), \dots, s_n^{\mathcal{B}}(\bar{a})) \in R^{\mathcal{B}} \Leftrightarrow \mathcal{B} \models \varphi(\bar{a}).$$

- (c) If  $\varphi$  is  $\neg\psi$ ,

$$\mathcal{A} \models \varphi(\bar{a}) \Leftrightarrow \mathcal{A} \not\models \psi(\bar{a}) \Leftrightarrow \mathcal{B} \not\models \psi(\bar{a}) \Leftrightarrow \mathcal{B} \models \varphi(\bar{a}),$$

where we use the induction hypothesis in the second  $\Leftrightarrow$ .

- (d) If  $\varphi$  is  $\psi_1 \vee \psi_2$ ,

$$\mathcal{A} \models \varphi(\bar{a}) \Leftrightarrow \mathcal{A} \models \psi_1(\bar{a}) \text{ or } \mathcal{A} \models \psi_2(\bar{a}) \Leftrightarrow \mathcal{B} \models \psi_1(\bar{a}) \text{ or } \mathcal{B} \models \psi_2(\bar{a}) \Leftrightarrow \mathcal{B} \models \varphi(\bar{a}),$$

where we use the induction hypothesis in the second  $\Leftrightarrow$ .

■

<sup>a</sup>Recall that we only need to show one of  $\vee$  or  $\wedge$ , and here we pick  $\vee$  and treat  $\wedge$  as an abbreviation.

**As previously seen (Characteristic).** Given a field  $K$ , the *characteristic*  $p$  of  $K$  is the number of 1 you need to add 1 in order to get 0, i.e.,  $\underbrace{1 + 1 + \dots + 1}_p = 0$ .

**Example.** Let  $L$  be a subfield of  $K$ , for each  $p > 0$ ,  $\varphi_p := \underbrace{1 + 1 + \dots + 1}_p = 0$ , which says the characteristic  $p$ .  $\varphi_p$  is **quantifier-free**, so

$$L \models \varphi_p \Leftrightarrow K \models \varphi_p.$$

**Example.** Consider  $\mathbb{Z} = (\mathbb{Z}, 0, 1, +, -, \cdot)$ , and let  $\varphi(x) := \neg \exists y \ y + y = x$ . We see that  $\mathbb{Z} \models \varphi(1)$  but  $\mathbb{Q} \models \neg \varphi(1)$ .

**Proposition 1.3.2.** Suppose that  $\mathcal{A}$  is a **substructure** of  $\mathcal{B}$ , and  $\varphi(\bar{x}, y_1, \dots, y_n)$  is a **quantifier-free formula**. Let  $\bar{a} \in \mathcal{A}$ , then

- (a) if  $\mathcal{A} \models \exists y_1 \dots \exists y_n \ \varphi(\bar{a}, y_1, \dots, y_n)$ , then  $\mathcal{B} \models \exists y_1 \dots \exists y_n \ \varphi(\bar{a}, y_1, \dots, y_n)$ ;
- (b) if  $\mathcal{B} \models \forall y_1 \dots \forall y_n \ \varphi(\bar{a}, y_1, \dots, y_n)$ , then  $\mathcal{A} \models \forall y_1 \dots \forall y_n \ \varphi(\bar{a}, y_1, \dots, y_n)$ .

**Proof.** Suppose that  $\mathcal{A} \models \exists y_1 \dots \exists y_n \ \varphi(\bar{a}, y_1, \dots, y_n)$ , so there are  $b_1, \dots, b_n \in \mathcal{A}$  such that  $\mathcal{A} \models \varphi(\bar{a}, b_1, \dots, b_n)$ . Since  $\varphi$  is **quantifier-free**, so  $\mathcal{B} \models \varphi(\bar{a}, b_1, \dots, b_n)$  from **Proposition 1.3.1**, and hence  $\mathcal{B} \models \exists y_1 \dots \exists y_n \ \varphi(\bar{a}, y_1, \dots, y_n)$ .

On the other hand, it's easy to see that (b) is implied by (a). ■

**Notation.** In **Proposition 1.3.2**, formulas as in (a) are called *existential* ( $\exists_1$  or  $\exists$ ) *formulas*; and formulas as in (b) are called *universal* ( $\forall_1$  or  $\forall$ ) *formulas*.

**Example.** Recall  $\mathcal{L}_1 = \{e, \cdot\}$ ,  $\mathcal{L}_2 = \{e, \cdot, {}^{-1}\}$ .

- Associativity:  $\forall x \forall y \forall z \ (xy)z = x(yz)$ .
- Identity:  $\forall x \ ex = xe$ .

These are  $\forall$ -formulas in either **language**.

- Inverses in  $\mathcal{L}_1$ :  $\forall x \exists y \ xy = yx = e$ , which is **not** an  $\forall$ -formula.
- Inverses in  $\mathcal{L}_2$ :  $\forall x \ xx^{-1} = x^{-1}x = e$ , which is an  $\forall$ -formula.

Hence, group axioms in  $\mathcal{L}_1$  are not universal, but in  $\mathcal{L}_2$  they are.

**Remark.** The above discrepancy is the reason why  $\mathcal{L}_2$  is better than  $\mathcal{L}_1$ , i.e.,  **$\mathcal{L}_1$ -substructure** might not be a group.

**Problem.** Show that  $\forall x \exists y \ xy = yx = e$  in the above example is not **equivalent** to an  $\forall$ -formula.

## Lecture 4: Theories and Axioms

**Example.** Let  $\mathcal{L}_1 = \{E\}$ , where  $E$  is a binary relation representing edge relation; and  $\mathcal{L}_2 = \{V, E, I\}$ , where  $V, E$  are unary relations and  $I$  is a binary relation representing incidence such that  $I(v, e)$  for  $v \in V, e \in E$  means that  $v$  is a vertex on edge  $e$ . Then,

- Let  $G$  be a graph, viewed as a  $\mathcal{L}_1$ -structure. A substructure of  $G$  is an induced subgraph  $H \subseteq G$  such that any edge in  $G$  between two vertices of  $H$  is in  $H$ .
- If we view  $G$  as an  $\mathcal{L}_2$ -substructure, a substructure is a subgraph  $H$  such that  $H$  has some vertices and edges from  $G$ .<sup>a</sup>

<sup>a</sup>But there might be edges in  $H$  with no vertices, which can be fixed by having two functions  $I_1(e) = v, I_2(e) = w$

when  $e: v \rightarrow w$ .

**Remark.** The difference is that for  $\mathcal{L}_1$ , having an edge is **quantifier-free**, while in  $\mathcal{L}_2$  is existential.

**Proof.** For  $\mathcal{L}_2$ ,  $vEw$  is **quantifier-free**, while in  $\mathcal{L}_2$ ,

$$\exists (v \in V \wedge w \in V \wedge e \in E \wedge I(v, e) \wedge I(w, e))$$

is not **quantifier-free**. \*

## 1.4 Theories

Let's start by the notion of **theory**.

**Definition 1.4.1 (Theory).** An  $\mathcal{L}$ -theory is a set of  $\mathcal{L}$ -sentences.

**Definition 1.4.2 (Model).**  $\mathcal{M}$  is a *model* of a **theory**  $T$ , written as  $\mathcal{M} \models T$ , if  $\mathcal{M} \models \varphi$  for all  $\varphi \in T$ .

**Note.** Not every **theory** has a **model**, e.g.,  $\{\exists x \, x \neq x\}$ .

**Definition 1.4.3 (Satisfiable).** A **theory** is *satisfiable* if it has a **model**.

**Definition 1.4.4 (Elementary class).** A class  $\mathcal{K}$  of  $\mathcal{L}$ -structures  $\mathcal{M}$  is called an *elementary class* if there is an  $\mathcal{L}$ -theory  $T$  such that

$$\mathcal{K} = \{\mathcal{M} \mid \mathcal{M} \models T\}.$$

One way to get an **elementary class** is to take an  $\mathcal{L}$ -structure  $\mathcal{M}$  and take the **full theory**.

**Definition 1.4.5 (Full theory).** The *full theory*  $\text{Th}(\mathcal{M})$  of an  $\mathcal{L}$ -structure  $\mathcal{M}$  is defined as  $\text{Th}(\mathcal{M}) = \{\varphi \mid \mathcal{M} \models \varphi\}$ .

From the definition,  $\mathcal{M} \models \text{Th}(\mathcal{M})$ , and  $\text{Th}(\mathcal{M})$  characterizes the **structures** satisfying the same **sentences** as  $\mathcal{M}$ .

**Definition 1.4.6 (Complete).** A **theory**  $T$  is *complete* if for any **sentence**  $\varphi$ , either  $\varphi \in T$  or  $\neg\varphi \in T$ .

**Remark.**  $\text{Th}(\mathcal{M})$  is **complete**.

**Definition 1.4.7 (Elementarily equivalent).**  $\mathcal{M}$  and  $\mathcal{N}$  are *elementarily equivalent*  $\mathcal{M} \equiv \mathcal{N}$  if for all **sentences**  $\varphi$ ,

$$\mathcal{M} \models \varphi \Leftrightarrow \mathcal{N} \models \varphi.$$

**Remark.** There are  $\mathcal{N} \models \text{Th}(\mathbb{N})$ , but  $\mathcal{N}$  is not isomorphic to  $\mathbb{N}$ .  $\mathcal{N}$  is called a *non-standard model of arithmetic*, and  $\mathcal{N}$  might have *infinite element* larger than all of  $\mathbb{N}$ . Here,  $\mathbb{N} = (\mathbb{N}, 0, 1, +, \cdot, -)$

**Example.**  $\mathbb{Z} \oplus \mathbb{Z} \not\cong \mathbb{Z}$  as groups.

The other way to define a **theory** is to write down axioms.

**Example (Infinite set).** Let  $\mathcal{L} = \emptyset$ , and let  $T$  consist of

$$\varphi_n := \exists x_1 \dots \exists x_n \bigwedge_{i \neq j} x_i \neq x_j.$$

**Example (Linear order).** Let  $\mathcal{L} = \{\leq\}$ , and let  $T$  consist of the axioms of linear orders, e.g.,

$$\forall x \forall y (x \leq y \wedge y \leq x \rightarrow x = y).$$

There are other interesting theories of linear orders, e.g., dense ones.

**Example (Dense linear order).** Consider

$$\forall x \forall y (x < y \rightarrow \exists z x < z < y),$$

where we use  $a < b$  as shorthand of saying  $a \leq b \wedge a \neq b$ .

**Example (Group).** In  $\mathcal{L}_{\text{group}} = \{e, \cdot, {}^{-1}\}$ , let  $T$  be the group axioms.

Other theories of groups include Abelson group, divisible, etc.

**Definition 1.4.8 (Finitely axiomatizable).** A theory is *finitely axiomatizable* if it has a finite axiomatization.

Given a theory, consider  $T^{\models} = \{\varphi : T \models \varphi\}$ ,<sup>2</sup> so  $\mathcal{M} \models T$  if and only if  $\mathcal{M} \models T^{\models}$ . Often we think of  $T$  and  $T^{\models}$  as the same. A theory  $T$  is *finitely axiomatizable* if there is a finite  $\Phi$  such that  $T^{\models} = \Phi^{\models}$ .

## 1.5 Elementary Embeddings

Let's now consider the following notion.

**Definition 1.5.1 (Elementary embedding).** Let  $\mathcal{M}$  and  $\mathcal{N}$  be  $\mathcal{L}$ -structures, and  $f: \mathcal{M} \rightarrow \mathcal{N}$  an  $\mathcal{L}$ -embedding. Then  $f$  is an *elementary embedding* if for any formula  $\varphi(\bar{x})$  and  $\bar{a} \in M$ ,

$$\mathcal{M} \models \varphi(\bar{a}) \Leftrightarrow \mathcal{N} \models \varphi(f(\bar{a})).$$

**Definition 1.5.2 (Elementary substructure).** If  $f: \mathcal{M} \hookrightarrow \mathcal{N}$  is an elementary embedding where  $\mathcal{M}$  is a substructure of  $\mathcal{N}$ , then  $\mathcal{M}$  is an *elementary substructure* of  $\mathcal{N}$ .

**Example.** As groups,  $\mathbb{Z} \hookrightarrow \mathbb{Q}$  is not elementary. In fact,  $\mathbb{Z} \not\equiv \mathbb{Q}$ . Whereas, if  $f: \mathcal{M} \hookrightarrow \mathcal{N}$  is an elementary embedding,  $\mathcal{M} \equiv \mathcal{N}$ .<sup>a</sup>

<sup>a</sup>And also much more is true.

**Proposition 1.5.1.** Every isomorphism is an elementary embedding.

**Proof.** Let  $f: \mathcal{M} \rightarrow \mathcal{N}$  be an isomorphism. We will argue by induction on formulas  $\varphi$ , that for all  $\bar{a} \in M$ ,

$$\mathcal{M} \models \varphi(\bar{a}) \Leftrightarrow \mathcal{N} \models \varphi(f(\bar{a})).$$

Firstly, observe that all cases except quantifiers are the same as Proposition 1.3.1. For quantifiers, suppose that  $\varphi(\bar{x})$  is  $\exists y \psi(\bar{x}, y)$  and  $\mathcal{M} \models \varphi(\bar{a})$ . This means that there is  $b \in M$  such that  $\mathcal{M} \models \psi(\bar{a}, b)$ . By the induction hypothesis,  $\mathcal{N} \models \psi(f(\bar{a}), f(b))$ , so  $\mathcal{N} \models \varphi(f(\bar{a}))$ .

Now suppose  $\mathcal{N} \models \varphi(f(\bar{a}))$ , then there is  $c \in N$  such that  $\mathcal{N} \models \psi(f(\bar{a}), c)$ . Since  $f$  is an

<sup>2</sup>Recall Definition 1.3.6.

isomorphism, so there is a  $b \in M$  such that  $f(b) = c$ . By the induction hypothesis,  $\mathcal{M} \models \psi(\bar{a}, b)$ , so  $\mathcal{M} \models \varphi(\bar{a})$ . ■

**Corollary 1.5.1.** If  $\mathcal{M} \cong \mathcal{N}$ , then  $\mathcal{M} \equiv \mathcal{N}$ .

## 1.6 Definable Sets

Consider the following.

**Definition 1.6.1** (Definable). Let  $\mathcal{M}$  be an  $\mathcal{L}$ -structure, then  $X \subseteq M^n$  is *definable* if there is a formula  $\varphi(x_1, \dots, x_n, \bar{y})$  and  $\bar{b} \in M$  such that

$$X = \{\bar{a} \in M^n \mid \mathcal{M} \models \varphi(\bar{a}, \bar{b})\}.$$

**Notation** (Define). We say that  $\varphi(\bar{x}, \bar{b})$  *defines*  $X$  over  $\bar{b}$ , written as  $X = \varphi(\mathcal{M}, \bar{b})$ .

**Notation** (Parameter). The tuple  $\bar{b}$  is called the *parameters* when  $X$  is *definable* over  $\bar{b}$ .

**Remark.** Sometimes  $X$  is *definable* without *parameters*, or *definable* over  $\emptyset$ .

**Example.** Take  $\mathbb{R} = (\mathbb{R}, 0, 1, +, \cdot, -)$  in  $\mathcal{L}_{\text{ring}}$ , then

$$\leq = \{(a, b) : a \leq b\}$$

is *definable*.

**Example.** Let  $\mathbb{Z} = (\mathbb{Z}, +, -, \cdot, 0, 1)$ , then  $\mathbb{N}$  is  $\emptyset$ -definable in  $\mathbb{Z}$  by<sup>a</sup>

$$\mathbb{N} = \{z \in \mathbb{Z} : \exists u, v, x, y \ u^2 + v^2 + x^2 + y^2 = z\}.$$

<sup>a</sup>From the **Langrange's four-square theorem**, which says that every natural number is the sum of four squares.

**Example.**  $\mathbb{Z}$  is  $\emptyset$ -definable in  $\mathbb{Q} = (\mathbb{Q}, +, -, \cdot, 0, 1)$ . This is a result of Julia Robinson [Rob49], and the formulation is very complicated.

**Problem.** How does one show that a set is not *definable*? For example,  $\mathbb{R}$  are not *definable* in  $\mathbb{C} = (\mathbb{C}, 0, 1, +, \cdot, -)$ .

## Lecture 5: Hilbert-style Deductive System

We start by asking whether  $\mathbb{R}$  is *definable* in  $\mathbb{C} = (\mathbb{C}, 0, 1, +, \cdot, -)$ ?

19 Jan. 14:30

**Proposition 1.6.1.** Let  $\mathcal{M}$  be an  $\mathcal{L}$ -structure, and let  $X \subseteq M^n$  be a set which is *definable* over  $\bar{a}$ . Then any *automorphism* of  $\mathcal{M}$  that fixes  $\bar{a}$  pointwise<sup>a</sup> fixes  $X$  setwise.<sup>b</sup>

<sup>a</sup>If  $\bar{a} = (a_1, \dots, a_m)$ , then  $f(a_i) = a_i$ .

<sup>b</sup>If  $b \in X$ , then  $f(b) \in X$ .

**Proof.** Let  $f$  be an *automorphism* of  $\mathcal{M}$  fixing  $\bar{a}$  pointwise, and  $X = \{\bar{b} \in M^n : \mathcal{M} \models \varphi(\bar{b}, \bar{a})\}$ . Fix  $\bar{b}$ , and suppose  $\bar{b} \in X$ , so  $\mathcal{M} \models \varphi(\bar{b}, \bar{a})$ . Because  $f$  is an *elementary embedding* from **Proposi-**

tion 1.5.1,

$$\mathcal{M} \models \varphi(f(\bar{b}), f(\bar{a})) \Rightarrow \mathcal{M} \models \varphi(f(\bar{b}), \bar{a}),$$

hence  $f(\bar{b}) \in X$ . Similarly, if  $\bar{b} \notin X$ ,  $\mathcal{M} \models \neg\varphi(\bar{b}, \bar{a}) \Rightarrow \mathcal{M} \models \neg\varphi(f(\bar{b}), \bar{a})$ , so  $f(\bar{b}) \notin X$ . ■

**Remark.** If  $X$  is  $\emptyset$ -definable, it is fixed setwise by any automorphism.

**Example.**  $\mathbb{N}$  is fixed setwise by any automorphism of the ring  $\mathbb{Z}$ . In fact, the only automorphism of  $\mathbb{Z}$  is the identity.

**Example.**  $\mathbb{N}$  is not  $\emptyset$ -definable in  $\mathbb{Z} = (\mathbb{Z}, 0, +)$ .

**Proof.** Consider an automorphism  $f(x) = -x$  of the group  $\mathbb{Z}$ , which does not fix  $\mathbb{N}$  setwise. \*

**Problem.** Is  $\mathbb{N}$  definable in  $\mathbb{Z} = (\mathbb{Z}, 0, +)$  over some parameters  $\bar{a}$ ?

**Answer.** For example, if  $\bar{a} = (1)$ , then  $f$  does not fix 1. In fact, any automorphism fixing 1 also fixes all of  $\mathbb{Z}$ , but  $\mathbb{N}$  is not definable in  $(\mathbb{Z}, 0, +)$ . To prove this we need compactness. \*

**As previously seen.** Given a field  $F$ , then  $F(a) \cong F(b)$  if  $a$  and  $b$  have the same minimal polynomial over  $F$  or if both do not satisfy any polynomial over  $F$ .

**Example.**  $\mathbb{Q}(\pi) \cong \mathbb{Q}(e)$  because  $\pi$  and  $e$  are both transcendental.

We now return to the big question: is  $\mathbb{R}$  definable in  $\mathbb{C} = (\mathbb{C}, 0, 1, +, \cdot, -)$ ? If  $f: \mathbb{Q}(a) \rightarrow \mathbb{Q}(b)$  such that  $a \mapsto b$ , then there is an automorphism  $\hat{f}: \mathbb{C} \rightarrow \mathbb{C}$  such that  $a \mapsto b$ , i.e.,  $\hat{f}$  extends  $f$ . In other words, we need to find such an  $f$  with  $a \in \mathbb{R}$  and  $b \notin \mathbb{R}$ .

**Example.**  $a = \pi$ ,  $b = i\pi$  are both transcendental.

**Example.**  $a$  is a real  $\sqrt[4]{2}$ ,  $b$  is a complex  $\sqrt[4]{2}$ .

The above two examples show that  $\mathbb{R}$  is not  $\emptyset$ -definable in  $\mathbb{C}$ . In fact,  $\mathbb{R}$  is not definable over any  $\bar{a}$  because there are elements of  $\mathbb{R}$  and  $\mathbb{C} \setminus \mathbb{R}$  transcendental over any  $\bar{a}$ .

**Intuition.** There are so many  $a, b$  such that given any  $\bar{a}$ , we can still find a pair that works.

## 1.7 Soundness, Completeness, and Compactness

In this section, we're going to formalize proofs.

### 1.7.1 Hilbert-style Deductive System

There are all sorts of different proof systems, and the one we use is the so-called Hilbert-style deductive system.

**Definition 1.7.2 (Proof).** A *proof* is a sequence of formulas  $\{\varphi_i\}_{i=1}^n$  such that  $\varphi_n$  is the conclusion.

Each formula is either a logical axiom or it follows from previous lines by a deductive rule.

**Definition 1.7.3 (Schema).** The axioms will be written using symbols for **formulas**, variables, etc.

**Definition 1.7.4 (Logical axioms).** We have the following *logical axioms*:

**Definition 1.7.5 (Propositional axioms).** The *propositional axioms* are:

- (A1)  $\varphi \rightarrow (\psi(\varphi))$ .
- (A2)  $(\varphi \rightarrow (\psi \rightarrow \Theta)) \rightarrow ((\varphi \rightarrow \psi) \rightarrow (\varphi \rightarrow \Theta))$ .
- (A3)  $(\neg\varphi \rightarrow \neg\psi) \rightarrow ((\neg\varphi \rightarrow \psi) \rightarrow \varphi)$ .

Besides, we also have

- (A4)  $\forall x \varphi(x, \dots) \rightarrow \varphi(t, \dots)$  where  $t$  is any **term**.
- (A5)  $[\forall x (\varphi \rightarrow \psi)] \rightarrow [(\forall x \varphi) \rightarrow (\forall x \psi)]$ .
- (A6)  $\varphi \rightarrow \forall x \varphi$ , where  $x$  is not free in  $\varphi$ .

Double check?

**Definition 1.7.6 (Axioms for equality).** The *Axioms for equality* are:

- (A7) for any **term**  $t, u, v$ , function symbols  $f$ , and relation symbols  $R$ ,
  - (a)  $t = t$ .
  - (b)  $t = u \rightarrow u = t$ .
  - (c)  $(t = u \wedge u = v) \rightarrow (t = v)$ .
  - (d)  $(u_1 = t_1 \wedge \dots \wedge u_{n_f} = t_{n_f}) \rightarrow f(u_1, \dots, u_{n_f}) = f(t_1, \dots, t_{n_f})$ .
  - (e)  $(u_1 = t_1 \wedge \dots \wedge u_{n_R} = t_{n_R}) \rightarrow R(u_1, \dots, u_{n_R}) \Leftrightarrow R(t_1, \dots, t_{n_R})$ .

We also have one rule of inference:

**Definition 1.7.7 (Modus Ponens).** From  $\varphi$  and  $\varphi \rightarrow \psi$ , deduces  $\psi$ .

We can also have proofs using a set of hypotheses  $\Gamma$ . In such a proof, in addition to a logical axiom, we can assert a **formula**  $\varphi \in \Gamma$ . If we prove  $\psi$  using  $\Gamma$  as hypotheses, we write  $\Gamma \vdash \psi$ .

**Definition 1.7.8 (Valid).** If we prove  $\psi$  without hypotheses, we write  $\vdash \psi$ , in which case we say  $\psi$  is *valid*.

These **formulas** might have **free variables**.

**Example.** A proof from calculus of a limit, e.g.,  $\forall \epsilon \exists \delta \dots$ . And we start by stating

- let  $\epsilon > 0$ ,
- choose  $\delta = \epsilon$ ,
- $\vdots$
- $|f(x) - f(y)| < \epsilon$ .

We should interpret **free variables** as representing an arbitrary

**Example.**  $\varphi \rightarrow (\psi \rightarrow \varphi)$  is a **schema**, i.e., an infinite set of axioms with all possible choices of  $\varphi$  and  $\psi$ .

---

As previously seen (Propositional logic).  $(p \wedge q) \vee (r \wedge \neg q)$ .

**Remark.** We can check whether the propositional axioms are true with a truth table.

**Definition 1.7.9** (Propositional tautology). A *propositional tautology* is a boolean combination of formulas  $\varphi_1, \dots, \varphi_n$  which is true via a truth table assigning true or false to each of  $\varphi_1, \dots, \varphi_n$ .

So instead of using propositional axioms, we could instead allow as logical axioms any propositional tautology.

To prove completeness, we will need 5 propositional tautologies. We will prove some of these, but take others on faith.

**Remark.** Propositional axioms are enough to prove all propositional tautologies.

**Notation.** We write  $\Gamma \vdash_{\mathcal{L}} \varphi$  if there is a proof of  $\varphi$  from  $\Gamma$  in the language  $\mathcal{L}$ .

**Note.** Passing to a larger language will not let you prove more, so we can just write  $\vdash$ .

### 1.7.2 Soundness

The idea is that if an  $\mathcal{L}$ -sentence  $\varphi$  is provable, then it is true in all  $\mathcal{L}$ -structures.

### 1.7.3 Completeness

If  $\varphi$  is true in all  $\mathcal{L}$ -structures, then it is provable.
