Lecture 8: The Fundamental Group π_1 24 Jan. 10:00

Example. In category <u>Ab</u> free Abelian group on a set S is

$$\bigoplus_S \mathbb{Z}.$$

In category of fields, no such thing as **free field on S**.

0.0.1   Constructing the Free Groups F_S

> **Proposition 0.1.** The free group defined by the universal property exists.

Proof. We'll just give a construction below. First, we see the definition.

> **Definition 0.1.** Fix a set S, and we define a <u>word</u> as a finite sequence (possibly $\varnothing$) in the formal symbols
> $$\left\{ s, s^{-1} \mid s \in S \right\}.$$

Then we see that elements in F_S are equivalence classes of words with the equivalence relation being

- delete ss^{-1} or $s^{-1}s$. i.e.,

$$vs^{-1}sw \sim vw$$
$$vss^{-1}w \sim vw$$

1

for every word $v, w, s \in S$,

with the group operation being concatenation. ∎

Example. Given words ab^{-1}, bba, their product is

$$ab^{-1} \cdot bba = ab^{-1}bba = aba.$$

Exercise. There are something we can check.

1. This product is well-defined on equivalence classes.

2. Every equivalence class of words has a unique *reduced form*, namely the representation.

3. Check that F_S satisfies the universal property with respect to the map

$$S \to F_S, \quad s \mapsto s.$$

1 The Fundamental Group π_1

We start with the definition.

Definition 1.1 (Path). A *path* in a space X is a continuous map

$$\gamma \colon I \to X$$

where $I = [0, 1]$.

Definition 1.2 (Homotopy path). A *homotopy of paths* γ_0, γ_1 is a homotopy from γ_0 to γ_1 rel$\{0, 1\}$.

$\gamma_0(0) = \gamma_1(0) \qquad \gamma_t \qquad \gamma_0(1) = \gamma_1(1)$

Example. Fix $x_1, x_0 \in X$, then $\exists$ homotopy of paths is an equivalence relation on paths from x_0 to x_1 (i.e., γ with $\gamma(0) = x_0, \gamma(1) = x_1$).

Definition 1.3 (Path composition). For paths α, β in X with $\alpha(1) = \beta(0)$, the *composition*[a] $\alpha \cdot \beta$ is

$$(\alpha \cdot \beta)(t) := \begin{cases} \alpha(2t), & \text{if } t \in \left[0, \dfrac{1}{2}\right] \\[2mm] \beta(2t - 1), & \text{if } t \in \left[\dfrac{1}{2}, 1\right]. \end{cases}$$

$\alpha(0)$ α $\alpha(1) = \beta(0)$ β $\beta(1)$

---
[a]Also named *product*, *concatenation*.

Remark. By the pasting lemma, this is continuous, hence $\alpha \cdot \beta$ is actually a path from $\alpha(0)$ to $\beta(1)$.

Definition 1.4 (Reparameterization). Let $\gamma \colon I \to X$ be a path, then a *reparameterization* of γ is a path

$$\gamma' \colon I \xrightarrow{\varphi} I \xrightarrow{\gamma} X$$

where φ is <u>continuous</u> and

$$\varphi(0) = 0, \quad \varphi(1) = 1.$$

Exercise. A path γ is homotopic rel$\{0, 1\}$ to all of its reparameterizations.

Proof. We show that γ and $\gamma \circ \phi$ are homotopic rel$\{0, 1\}$ by showing that there exists a continuous F_t such that

$$F_0 = \gamma, \quad F_1 = \gamma \circ \phi.$$

Notice that since ϕ is continuous, so we define

$$F_t(x) = (1 - t)\gamma(x) + t \cdot \gamma \circ \phi(x).$$

We see that

$$F_0(x) = \gamma(x), \quad F_1(x) = \gamma \circ \phi(x),$$

and also, we have

$$F_t(x) \in X$$

for all $x, t \in I$.

Now, we check that F_t really gives us a homotopic rel$\{0,1\}$. We have

$$F_t(0) = (1-t)\gamma(0) + t \cdot \gamma \circ \phi(0) = (1-t)\gamma(0) + t \cdot \gamma(\underbrace{\phi(0)}_{0}) = \gamma(0),$$

$$F_t(1) = (1-t)\gamma(1) + t \cdot \gamma \circ \phi(1) = (1-t)\gamma(1) + t \cdot \gamma(\underbrace{\phi(1)}_{1}) = \gamma(1),$$

which shows that 0 and 1 are independent of t, hence γ and $\gamma \circ \phi$ are homotopic rel$\{0,1\}$. ∎

Exercise. Fix $x_1, x_1 \in X$. Then <u>Homotopy of paths</u> (relative $\{0,1\}$) is an equivalence relation on paths from x_0 to x_1.

Definition 1.5 (Fundamental Group). Let X denotes the space and let $x_0 \in X$ be the base point. The *fundamental group of X based at x_0,* denoted by $\pi_1(X, x_0)$, is a group such that

- Elements: Homotopy classes rel$\{0,1\}$ of paths $[\gamma]$ where γ is a **loop** with $\gamma(0) = \gamma(1) = x_0$ [a]

- Operation: Composition of paths.
- Identity: Constant loop γ based at x_0 such that

$$\gamma: I \to X, \quad t \mapsto x_0$$

- Inverses: The inverse $[\gamma]^{-1}$ of $[\gamma]$ is represented by the loop $\overline{\gamma}$ such that

$$\overline{\gamma}(t) = \gamma(1-t).$$

---
[a]We say γ is **based** at x_0.

Proof. We prove that

- Associativity: $[\gamma_1 \cdot (\gamma_2 \cdot \gamma_3)] = [(\gamma_1 \cdot \gamma_2) \cdot \gamma_3]$. We break this down into

$$
\gamma_1 \cdot (\gamma_2 \cdot \gamma_3)(t) = \begin{cases} \gamma_1(2t), & \text{if } t \in \left[0, \dfrac{1}{2}\right]; \\ (\gamma_2 \cdot \gamma_3)(2t - 1), & \text{if } t \in \left[\dfrac{1}{2}, 1\right] \end{cases} = \begin{cases} \gamma_1(2t), & \text{if } t \in \left[0, \dfrac{1}{2}\right]; \\ \gamma_2(4t - 2), & \text{if } t \in \left[\dfrac{1}{2}, \dfrac{3}{4}\right]; \\ \gamma_3(4t - 3), & \text{if } t \in \left[\dfrac{3}{4}, 1\right], \end{cases}
$$

and

$$
(\gamma_1 \cdot \gamma_2) \cdot \gamma_3(t) = \begin{cases} (\gamma_1 \cdot \gamma_2)(2t), & \text{if } t \in \left[0, \dfrac{1}{2}\right]; \\ \gamma_3(2t - 1), & \text{if } t \in \left[\dfrac{1}{2}, 1\right] \end{cases} = \begin{cases} \gamma_1(4t), & \text{if } t \in \left[0, \dfrac{1}{4}\right]; \\ \gamma_2(4t - 1), & \text{if } t \in \left[\dfrac{1}{4}, \dfrac{1}{2}\right]; \\ \gamma_3(2t - 1), & \text{if } t \in \left[\dfrac{1}{2}, 1\right]. \end{cases}
$$

Then, we define $\phi \colon I \to I$ such that

$$
\phi(t) = \begin{cases} 2t \in \left[0, \dfrac{1}{2}\right], & \text{if } t \in \left[0, \dfrac{1}{4}\right]; \\ t + \dfrac{1}{4} \in \left[\dfrac{1}{2}, \dfrac{3}{4}\right], & \text{if } t \in \left[\dfrac{1}{4}, \dfrac{1}{2}\right]; \\ \dfrac{t + 1}{2} \in \left[\dfrac{3}{4}, 1\right], & \text{if } t \in \left[\dfrac{1}{2}, 1\right]. \end{cases}
$$

We easily see that

$$
\gamma_1 \cdot (\gamma_2 \cdot \gamma_3)(t) = (\gamma_1 \cdot \gamma_2) \cdot \gamma_3 \circ \phi(t)
$$

and $\phi(t)$ is continuous and satisfied $\phi(0) = 0$ and $\phi(1) = 1$, which implies that the associativity holds.

- Identity: We want to show that $[\gamma \cdot c] = [\gamma]$. Again, we consider

$$
(\gamma \cdot c)(t) = \begin{cases} \gamma(2t), & \text{if } t \in \left[0, \dfrac{1}{2}\right]; \\ c(2t - 1) = c = x_0 = \gamma(0), & \text{if } t \in \left[\dfrac{1}{2}, 1\right]. \end{cases}
$$

Now, consider $\phi \colon I \to I$ such that

$$
\phi(t) = \begin{cases} 2t, & \text{if } t \in \left[0, \dfrac{1}{2}\right]; \\ 1, & \text{if } t \in \left[\dfrac{1}{2}, 1\right]. \end{cases}
$$

We easily see that
$$
(\gamma \cdot c)(t) = (\gamma \circ \phi)(t)
$$
and $\phi(t)$ is continuous and satisfied $\phi(0) = 0$ and $\phi(1) = 1$.

- Inverses: We want to show that $\gamma \cdot \overline{\gamma} \simeq c$, where $\overline{\gamma}(t) = \gamma(1-t)$. Firstly, we have

$$(\gamma \cdot \overline{\gamma})(t) = \begin{cases} \gamma(2t), & \text{if } t \in \left[0, \dfrac{1}{2}\right]; \\ \overline{\gamma}(1-2t), & \text{if } t \in \left[\dfrac{1}{2}, 1\right]. \end{cases}$$

We consider F_t given by

$$F_t(x) = \begin{cases} \gamma(2xt), & \text{if } x \in \left[0, \dfrac{1}{2}\right]; \\ \overline{\gamma}(1-2xt), & \text{if } x \in \left[\dfrac{1}{2}, 1\right]. \end{cases}$$

If $t = 0$, we have

$$F_0(x) = \begin{cases} \gamma(0), & \text{if } x \in \left[0, \dfrac{1}{2}\right]; \\ \overline{\gamma}(1), & \text{if } x \in \left[\dfrac{1}{2}, 1\right] \end{cases} = x_0$$

for all $x \in I$, namely $F_0 = c$, while when $t = 1$, we have

$$F_1(x) = \begin{cases} \gamma(2x), & \text{if } x \in \left[0, \dfrac{1}{2}\right]; \\ \overline{\gamma}(1-2x), & \text{if } x \in \left[\dfrac{1}{2}, 1\right] \end{cases} = (\gamma \cdot \overline{\gamma})(x),$$

and we see that F_t is continuous since at $x = \frac{1}{2}$, we have

$$\gamma(2x) = \gamma(1) = \overline{\gamma}(0) = \overline{\gamma}(1-2x),$$

hence we see that F_t is the homotopy between $\gamma \cdot \overline{\gamma}$ and c.

Figure 1: Illustration of F_t. Intuitively, the path $\gamma \cdot \overline{\gamma}$ is $x_0 \xrightarrow{\gamma} x_0 \xrightarrow{\overline{\gamma}} x_0$. But now, F_t is $x_0 \xrightarrow{\gamma} t \xrightarrow{\overline{\gamma}} x_0$. We can think of this homotopy is *pulling back* the turning point along the original path.

∎

Theorem 1.1. If X is path-connected, then

$$\forall x_0, x_1 \in X \quad \pi_1(X, x_0) \cong \pi_1(X, x_1).$$

Remark. We often write $\pi_1(X)$ up to isomorphism.

Proof. To show that the *change-of-basepoint map* is isomorphism, we show that it's one-to-one and onto.

- one-to-one. Consider that if $[h \cdot \gamma \cdot \overline{h}] = [h \cdot \gamma' \cdot \overline{h}]$, then since we know that $h^{-1} = \overline{h}$, hence in the fundamental group $\pi_1(X, x_0)$, we see that

$$\overline{h} \cdot h \cdot \gamma \cdot \overline{h} \cdot h = \overline{h} \cdot h \cdot \gamma' \cdot \overline{h} \cdot h. \implies \gamma = \gamma'$$

  as we desired.

- onto. We see that for every $\alpha \in \pi_1(X, x_0)$, there exists a $\gamma \in \pi_1(X, x_0)$ such that

$$\gamma = \overline{h} \cdot \alpha \cdot h \in \pi_1(X, x_1)^{1}$$

  since $h \cdot \gamma \cdot \overline{h} = \alpha$.

We then see that the fundamental group of X does not depend on the choice of basepoint, only on the choice of the path component of the basepoint. If X is path-connected, it now makes sense to refer to *the* fundamental group of X and write $\pi_1(X)$ for the abstract group (up to isomorphism).

■

Exercise. Composition of paths is well-defined on homotopy classes rel$\{0, 1\}$.

Exercise. If X is a contractible space, then X is path connected and $\pi_1(X)$ is trivial.

Lecture 9: Calculate Fundamental Group
26 Jan. 10:00

Figure 2: Fundamental Group is basically a *hole detector*!

---

[1] Notice that this is indeed the case, one can verify this by the fact that $h\colon x_0 \to x_1$ and $\overline{h}\colon x_1 \to x_0$.

Theorem 1.2. Given (X, x_0) and (Y, y_9), then

$$\pi(X \times Y, (x_0, y_0)) \cong \pi_1(X, x_0) \times \pi_1(Y, y_0)$$

such that

$$\begin{bmatrix} r \colon I \to X \times Y \\ r(t) = (r_X(t), r_Y(t)) \end{bmatrix} \mapsto (r_X, r_Y),$$

where γ is continuous $\iff f_X, f_Y$ are continuous.

Proof. Let $Z \to X \times Y$ with $z \mapsto (f_X(z), f_Y(z))$. Then we have

$$\text{continuous} \iff f_X, f_Y \text{ are continuous.}$$

Now, apply to

- $I \to X \times Y$.

- $I \times I \to X \times Y$.

$\blacksquare$
Corollary 1.1. Torus $T \cong S^1 \times S^1$. Additionally,

$$\pi_1\left((S^1)^k\right) \cong \mathbb{Z}^k.$$

Proof. Since

$$\pi_1 \cong \mathbb{Z}^2 \cong \mathbb{Z}_a \oplus \mathbb{Z}_b.$$

$\blacksquare$

Example. We now see some examples.

1. $\pi_1(S^\infty \times S^1) \cong \mathbb{Z}$

2. $\pi_1(\mathbb{R}^2 \setminus \{0\}) \cong \mathbb{Z}$ since

$$\mathbb{R}^2 \setminus \{0\} \cong S^1 \times \mathbb{R}.$$

Theorem 1.3. Let π_1 is a functor

$$\pi_1 \colon \underline{\mathrm{Top}_*} \to \underline{\mathrm{Gp}}$$
$$(X, x_0) \mapsto \pi_1(X, x_0).$$

A map $f \colon X \to Y$ taking base point x_0 to y_0 induces a map

$$f_* \colon \pi_1(X, x_0) \to \pi_1(Y, y_0)$$
$$[\gamma] \mapsto [f \circ \gamma]$$

i.e.,

$$[f \colon X \to Y] \mapsto [f_* \colon \pi_1(X, x_0) \to \pi_1(Y, f(x_0))].$$

Notation. We usually write f_* if it's a covariant functor, while writing f^* if it's an contravariant functor.

Proof. We need to check

- well-defined on path homotopy classes.

- f_* is a group homomorphism.

$$f_*(\alpha \cdot \beta) = f_*(\alpha) \cdot f_*(\beta) = \begin{cases} f(\alpha(2s)), & \text{if } s \in \left[0, \dfrac{1}{2}\right] \\ f(\beta(1 - 2s)), & \text{if } s \in \left[\dfrac{1}{2}, 1\right]. \end{cases}$$

- $\left(\mathrm{id}_{(X, x_0)}\right)_* = \mathrm{id}_{\pi_1(X, x_0)}$

- $(f_* \circ g_*) = (f \circ g)_*$

$$(f \circ g)_*[\gamma] = [f \circ g \circ \gamma] = [f \circ (g \circ \gamma)] \implies f_*(\gamma_*(\gamma)).$$

DIY

∎

Lecture 10: Seifert-Van Kampen Theorem

26 Jan. 10:00

The goal is to compute $\pi_1(X)$ where $X = A \cup B$ using the data of $\pi_1(A), \pi_1(B), \pi_1(A \cap B)$.

We first introduce a definition.

Definition 1.6 (Free product with amalgamation). Given some collections of groups $\{G_\alpha\}_\alpha$, the *free product*, denoted by $\underset{\alpha}{*}G_\alpha$ is a group such that

- Elements: Words in $\{g \colon g \in G_\alpha \text{ for any } \alpha\}$ modulo by the equivalence relation generated by

$$wg_ig_jv \sim w(g_ig_j)v$$

  when both $g_i, g_j \in G_\alpha$. Also, for the identity element $\mathrm{id} = e_\alpha \in G_\alpha$ for any α such that

$$we_\alpha v \sim wv.$$

- Operation: Concatenation of words.

Furthermore, if groups G_α and G_β have a common subgroup S, given two inclusion maps $i_\alpha \colon H \to G_\alpha$ and $i_\beta \colon H \to G_\beta$, the *free product with amalgamation* $\underset{\alpha}{*}_S G_\alpha$ is defined as $\underset{\alpha}{*}G_\alpha$ modulo the normal subgroup generated by

$$\left\{ i_\alpha(s)i_\beta(s)^{-1} \mid s \in S \right\}\,{}^{[2]}$$

and satisfies the universal property

$$
\begin{array}{ccc}
S & \xrightarrow{\;\;i_\alpha\;\;} & G_\alpha \\
{\scriptstyle i_\beta}\big\downarrow & & \big\downarrow \\
G_\beta & \longrightarrow & G_\alpha *_S G_\beta \\
& & \quad\quad\searrow^{\exists!} \\
& & \quad\quad\quad X
\end{array}
$$

Namely, $i_\alpha(s)$ and $i_\beta(s)$ will be identified in the quotient.

Remark. We see that

- We can then write out words such as $g_1g_2sg_3$ for $s \in S$, and view s as an element of G_α or G_β. In fact, we can do this construction even when i_α and i_β are not injective, though this means we are not working with a subgroup.

- Aside, in $\underline{\mathrm{Top}}$, the same universal property defines union

$$
\begin{array}{ccc}
A \cap B & \xrightarrow{\;\;i_\alpha\;\;} & A \\
{\scriptstyle i_\beta}\big\downarrow & & \big\downarrow \\
B & \longrightarrow & A \cup B \\
& & \quad\quad\searrow^{\exists!} \\
& & \quad\quad\quad X
\end{array}
$$

for A, B are open subsets and the inclusion of intersection.

Theorem 1.4 (Seifert-Van Kampen Theorem). Given (X, x_0) such that $X = \bigcup_\alpha A_\alpha$ with

- A_α are open and path-connected and $\forall \alpha\ x_0 \in A_\alpha$

- $A_\alpha \cap A_\beta$ is path-connected for all α, β.

Then there exists a surjective group homomorphism

$$\underset{\alpha}{*}\colon \pi_1(A_\alpha, x_0) \to \pi_1(X, x_0).$$

If we additionally have $A_\alpha \cap A_\beta \cap A_\gamma$ where they are all path-connected for every α, β, γ, then
$$\pi_1(X, x_0) \cong {}_\alpha *_{\pi_1(A_\alpha \cap A_\beta, x_0)} \pi_1(A_\alpha, x_0)$$

associated to all maps $\pi_a(A_\alpha \cap A_\beta) \to \pi_1(A_\alpha), \pi_1(A_\beta)$ induced by inclusions of spaces. i.e., $\pi_1(X, x_0)$ is a quotient of the free product $*_\alpha \pi_1(A_\alpha)$ where we have

$$(i_{\alpha\beta})_*\colon \pi_1(A_\alpha \cap A_\beta) \to \pi_1(A + \alpha)$$

which is induced by the inclusion $i_{\alpha\beta}\colon A_\alpha \cap A_\beta \to A_\alpha$. We then take the quotient by the normal subgroup generated by

$$\{(i_{\alpha\beta})_*(\gamma)(i_{\beta\alpha})_* \mid \gamma \in \pi_1(A_\alpha \cap A_\beta)\}.$$

Example.
